

YUNKUN (RICKY) LU

Software Engineer | Distributed Systems | AI Infrastructure | LLM Agents

📍 Los Angeles, CA in <https://www.linkedin.com/in/yunkun-lu/> 🌐 <https://www.github.com/PaperbagLife>

EDUCATION

University of Southern California M.S. in Computer Science

📅 2025 August - 2027 May

📍 Los Angeles, CA

GPA - 4.00 (ongoing)

Carnegie Mellon University B.S. in Computer Science, Minor in Computational Finance

📅 2018 August - 2022 May

📍 Pittsburgh, PA

GPA - 3.80/4.00 Distributed Systems, Artificial intelligence, Algorithms

WORK EXPERIENCE

Google

Software Engineer Intern

📅 May 2026 - Aug 2026

📍 AI Infrastructure

- Built an LLM agent in Python that automatically gathers diagnostic evidence from multiple data sources and assembles it into a structured triage report for failed machine tests, cutting initial investigation from hours to under 20 minutes via parallelized agent workflows
- Designed and implemented a telemetry pipeline and monitoring dashboard tracking datacenter diagnostic coverage across thousands of machines, enabling fleet-wide visibility into agent execution and data quality

Clockwork Systems

Software Engineer

📅 July 2022 - July 2025

📍 clockwork.io

- Built the GPU training cluster end-to-end with one other engineer: planned and stacked the switch, racked and cabled 5 servers, and configured + validated Infiniband/RoCE fabric performance
- Designed and built internal GPU-cluster monitoring platform from the ground up (Flask + Vue/TypeScript), replacing a manual pre-test health check with a single page load.
- Built the telemetry subsystem for a NCCL plugin that mitigates ECMP hash-collision congestion on RoCE/Infiniband fabrics by rerouting collective traffic based on measured path load - 20% higher allreduce throughput vs. stock NCCL on default ECMP

Arista Networks

Software Engineer Intern

📅 June 2021 - Aug 2021

- Migrated existing service to run on Kubernetes, reducing CPU usage of bare metal servers by up to 10%
- Designed and implemented CI/CD pipeline to automate deployment of new builds to Kubernetes clusters, saved 20 min per future deployment
- Reformatted excessive verbose logging into JSON strings, reduced database load by 70% and made parsing easier

PROJECTS

Multiplayer Party Game, Hamster Mapster

Gameplay Engineer

📅 Launching on Steam in 2027

- Designing and implementing procedural map generation system for a 4-player party game
- Built multi-biome tile-based generation algorithm that creates balanced, playable maps with configurable difficulty
- Collaborated with team of 20, including 3 other engineers to integrate map generation with game mechanics and UI

SKILLS

Languages: Python, C++, Golang, TypeScript, JavaScript, SQL

AI & ML: LLMs, Agentic Workflows, Prompt Engineering, Autonomous Agents

Distributed Systems: Kubernetes, Docker, NCCL, RDMA, Infiniband, RoCE

Data & Monitoring: Grafana, SQL, Telemetry Pipelines, CI/CD
